The purpose of the metal brackets is to stabilise the dartboard and ensure it does not move once installed inside the cabinet.

You will notice two holes on the outside edges of the cabinet. Push the screws through these holes, you may need to puncture a small amount of fabric inside.

Place bracket over screws on inside of cabinet and screw on the nuts to secure the bracket to the cabinet.

This will then allow you to slide the bracket up and down in order to install/remove the dartboard.
